

Emotional Assistant

Matthias Hock, Tobias Louia, Teresa Naredi-Rainer, Sana Nasir, Irina Vetter, Anna Welker, Florena Raja

Overview

- Initial idea
- Problems / Questions
- Expert interview
- Technical Progress
 - User Interaction Prototype
 - Use Case Scenarios

Initial idea

- **Goal:**

Assist people who have recently experienced *Burnout* in reintegrating into their workplace

Initial idea

- Goal: Assist the user in reintegrating into workplace after burnout
- **TEK Model**
(Training Emotionaler Kompetenzen nach Berking)

Initial idea

- Goal: Assist the user in reintegrating into workplace after burnout
- TEK Model
- **Character:**
 - React to user's mood via mimicry
 - “Kindchenschema”: soothing appearance, and convey artificial agent's limited capabilities
- **Animal assisted therapy (AAT)**

Problems / Questions

- How should the pet behave?
- What behaviours might be counterproductive towards helping the patient?
- What kind of feedback should the character give?
- How does therapy with a burnout patient really look like?
- How does an actual therapist view our idea?

Expert interview

- Goal: Assist the user during time between inpatient and outpatient treatment (therapy)
- Support in psychoeducation and emotion regulation
- Integration of knowledge into everyday life
- Activate the patient
- Character
 - cute vs. cartoony
 - mimicking or not mimicking

Incorporation of Interview suggestions

- More engaging interaction design: continuous presence of virtual character to improve engagement and relationship with character
- New feature: suggest small activities and give encouraging feedback
 - Leave emotionally sensitive topics to actual therapist
 - Give user the feeling of not being alone when time between real-life session increases
- Keep muscle and breathing relaxation sessions
- Increase focus on psychoeducation

Technical Progress

- Emotion detection through voice characteristics
 - Using EmoVoice (implemented in SSI)
 - Not very accurate yet → Improve
- 3D avatar displayed through jMonkeyEngine, embedded in VSM
 - Possible to display characters and control through VSM
- Storyboards and prototypes for User Interaction

Storyboards

I FEEL AWFUL, NOT A GOOD DAY,
I'm not upto the mark

Alexandra, is upset & dejected that she's not
in her A game.

maybe I should relax,
try out some exercises
lets look at VPAPP

Alexandra is aware that the
virtual pet app comes with
exercise options & wants to try
them

EXERCISES

okay, lets try the
exercises!!

MUSCLE
RELAXATION

BREATHING
1/2

upon choosing exercises, Alexandra is
presented with few exercises options.

BREATHING

00:00

REWARDS

Alexandra chooses the exercises &
corresponding exercise is played
with pet assisting & finally rewards
to win.

The breathing exercises,
did help, I feel a little
better, maybe I should
try more

Alexandra feels relaxed & wants to
try more. Getting rewards also makes
her feel better.

WHAT A STRESSFUL
DAY!!
I CANNOT COPE WITH
THIS. I'm MISERABLE

Alexandra, has a stressful & unproductive day, feels low & miserable.

WISH I COULD TALK TO
SOMEONE
OH!! LET'S USE THE
VIRTUAL PET APP

Alexandra wants to talk to someone,
mostly someone who doesn't judge
her situation. She turns towards
the Virtual Pet for assistance

EXERCISES

Okay, seems like I can
choose a pet, there are
some exercises...

I'm not sure if I want to try
the exercises, let me talk

Alexandra, opens the Desktop App, Virtual pet
and finds the options the App offers,
which is talk to the pet or try
few exercises.

I'll name
it Tom
Hi Tom

Alexandra names her pet & talks to the
pet
Tom listens to Alexandra & emits
basic emotions, like attentive ears,
wagging tail, purr...

This is good, maybe
I should do more of
this & look at the
exercises

Alexandra, likes the talking session &
would like to do it often & maybe
try the exercises.

Use Case Scenarios

1: Muscle Relaxation

Primary Actor: User

Goal: User completes the muscle relaxation exercise.

Preconditions:

- The system is running properly.
- User has done with introduction part.

Scenario:

1. The user opens the Emma application on his system.
2. The user selects the Muscle Relaxation mode.
3. The user follows application timer and instructions.

Exceptions:

EX 1.1. The system is not running properly.

Priority: High priority

Frequency: High

Use Case Scenarios

2: Breath Relaxation

Primary Actor: User

Goal: User completes the breath relaxation exercise.

Preconditions:

- The system is running properly.
- User has done with introduction part.

Scenario:

1. The user opens the Emma application on his system.
2. The user selects the Breath Relaxation mode.
3. The user follows application timer and instructions.

Exceptions:

EX 1.1. The system is not running properly.

Priority: High priority

Frequency: High

Use Case Scenarios

3: Track Positive Activities

Primary Actor: User

Goal: Track the user's activities.

Preconditions:

- The system is running properly.

Scenario :

1. The user opens the EmmA Application
2. Chooses the activities which the user has done for the day

Exceptions:

EX 1.1. The system is not running properly.

Priority: High priority

Frequency: High

**Thank you for
listening**
